

How an Indian Private Bank came close to achieving 100% End Point Compliance

Anakage's automation platform enabled a leading private bank, based out of the finance capital of India, to achieve 99% compliance, significantly reducing manual intervention and boosting operational efficiency.

CLIENT'S SITUATION

The bank has aspired to be 100% compliant across its extensive IT infrastructure. Previous manual efforts maintained compliance levels between 90-95%, which left some endpoints at risk and vulnerable to potential security threats. The absence of a unified monitoring dashboard and reliance on disparate tools previously led to inefficiencies, frequent service disruptions, and increased operational risks.

THE SOLUTION

Anakage deployed its advanced automation platform to tackle the bank's compliance challenges. This included automated compliance checks and self-healing features for proactive issue resolution. A centralized dashboard provided real-time visibility, enabling the proactive detection and resolution of non-compliance issues such as restarting critical services, identifying and re-installing corrupted agents without any manual intervention. The solution also automated configuration management, ensuring consistent compliance and strengthening operational stability across the entire IT infrastructure.

RESULT

By remediating non-compliant end-points, Client IT achieved close to its target 100% Compliance levels while reducing time and effort by 85%, shifting from manual checks to automated detection & remediation. This proactive approach towards issue detection kept critical services operational, reduced downtime, and mitigated non-compliance risks. This achievement solidified the bank's ability to maintain stringent compliance standards, fostering trust with customers.
